Write queries for the following questions:

1. Display all customers who live in 'Delhi'.
2. Find the average rating of all restaurants in 'Mumbai'.
3. List all customers who have placed at least one order.
4. Display the total number of orders placed by each customer.
5. Find the total revenue generated by each restaurant.
6. Find the top 5 restaurants with the highest average rating.
7. Display all customers who have never placed an order.
8. Find the number of orders placed by each customer in 'Mumbai'.
9. Display all orders placed in the last 30 days.
10. List all delivery partners who have completed more than 1 delivery
11. Find the customers who have placed orders on exactly three different days.
12. Find the delivery partner who has worked with the most different customers.
13. Identify customers who have the same city and have placed orders at the same restaurants, but on different dates.

1. Display all customers who live in 'Delhi'.

--Display all customers who live in 'Delhi'.

```
SELECT * FROM swiggydb.customers;
```

```
SELECT
```

```
    *
```

```
FROM
```

```
    customers
```

```
WHERE
```

```
    city = 'delhi';

2. Find the average rating of all restaurants in 'Mumbai'.

```
SELECT * FROM swiggydb.restaurants;
```

```
--Find the average rating of all

3. List all customers who have placed at least one order.

```
SELECT * FROM swiggydb.customers;
```

```
-- List all customers who have placed at least one order.
```

```
SELECT DISTINCT
```

```
    customers.name
```

```
FROM
```

```

```

```
    INNER JOIN
```

```
    orders ON customers.customer_id = orders.customer_id;
```

```

4. Display the total number of orders placed by each customer.

```
SELECT * FROM swiggydb.orders;
```

```
-- Display the total number of orders placed by  
each customer.
```

```
SELECT
```

```
    customers.name, count(orders.order_id)

5. Find the total revenue generated by each restaurant.

```
LECT * FROM swiggydb.orders;
-- Find the total revenue generated by each
restaurant
SELECT
    restaurants.name,
    SUM(orders.total_amount)
FROM
    restaurants
    LEFT JOIN
        orders ON orders.restaurant_id =
restaurants.restaurant_id
GROUP BY restaurants.name;
```

The screenshot shows a database interface with a 'Result Grid' tab. It displays the results of a SQL query, showing the restaurant names and their total revenue. The table has two columns: 'name' and 'SUM(orders.total_amount)'. The data is as follows:

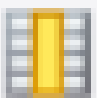

| | name | SUM(orders.total_amount) |
|---|-----------------|--------------------------|
| ▶ | Spice of India | 1100.00 |
| | Tandoori Flames | 1200.00 |
| | Biryani House | 5300.00 |

| | Royal Biryani | 650.00 |
| | Coastal Delight | 2100.00 |
| | Veggie Delight | 1600.00 |
| | Gujarat Express | 2550.00 |

At the bottom, there are tabs for 'orders_1' and 'Result 2'.

6. Find the top 5 restaurants with the highest average rating.

```
SELECT * FROM  
swiggydb.restaurants;  
-- Find the top 5 restaurants with the  
highest average rating.
```

```
SELECT  
    name, rating

7. Display all customers who have never placed an order.

-- Display all customers who have never placed an order.

```
SELECT
    customers.customer_id,
    customers.name
